

PATCH BURN GRAZING

WHAT IS IT ?

Patch-burn is a good technique that you can apply in your sustainable grazing. It helps to manage the grassland that certain areas of the paddock will be burned in a certain year to attract the grazing livestock.

WHY CHOOSE IT?

Improves the quality of the whole habitat, boosts the biomass diversity. Also, enable the regrowth and recovery.

It a great cost-saving technology that requires less costly infrastructure or fencing to achieve a comprehensive and sustainable grazing system.

LIFT CYCLE

Patch-burn requires at least 3 years to accomplish for the whole life cycle. Therefore, take your time that burns 1/4 of the whole paddock each year in rotation and enjoy the benefits from the very start.

SECOND YEAR

we suggest you conduct planned burn on another section of the rest unburned area that continuous from last year's efforts.

And livestock should firstly graze in the latest burned area. That is, the burned area in the 1st year can have enough time to regrowth and rest.
